Amendments to the Claims:

This listing of claims will replace all prior versions and listings, of claims in the application:

Listing of Claims:

 (Currently Amended) A Format selector device-for-a-wiping-material dispensing appliance, the appliance comprising;

a housing with lateral flanges, between which are arranged the housing comprising a drum receiving a cutting blade, a reel of materials, a pressing roller or a guide roller arranged between the flanges.

wherein the a format selector device makes it possible configured to control a dispensing of formats of strips of materials in a ratio of one to two,

position of the format selector device comprising a small format position and a large format position allowing emergence of the cutting blade from the drum at each revolution of the drum for when the device is in the small format position and at every two revolutions of the drum when the device is in for a the large format position.

the selector device acting and causing a relation between a set of pinions (P1, P2, P3, P4, P5, P6, P7) meshing with one another in the small-format dispensing situation position, and some pinions (P2, P3, P7) of the pinions being disengaged punctually over a drum revolution in the large-format position dispensing and eaneelling to avoid emergence of the cutting blade from the drum, and

the selector device [[is]] positioned, from a lateral flange of the housing, on an outside and on an inside of the housing, and comprises comprising an operating lever including two fixed stops spaced apart and arranged on the flange, at the same time defining an angular spacing α

corresponding to a tilt-position of the[[a]] lever in an upper or lower part, depending on a selected format corresponding to the small format and the large format, and the

a movementilt of said operating lever aets-with anacting to cause an axial push on a pusher member guided on a hub receiving a first pinion and a second pinion of the two-pinions (P1—P2) set up according to an axis Y, and, by function of position of the lever, the pusher member configured to cause eauses connection between the second pinion and a third pinion the pinions (P2 and P3) to cause and therefore emergence of the cutting blade at each revolution of the drum [[or]] and to cause_retraction of the pinion (P3) third pinion to cause_and-the emergence of the cutting blade once every two revolutions of the drum.

- 2. (Currently Amended) Format-selector-device The appliance according to Claim 1, wherein the second pinion (P2)-cooperates by meshing with a said third pinion (P3) which is mounted on a retractable flap and according to an axis W, and said first pinion (P4)-cooperates with a fifth pinion (P5)-associated with a pressing roller, and the a seventh pinion (P7) is arranged at the end of the drum receiving the cutting blade and cooperates with the third pinion (P3).
- 3. (Currently Amended) Selector device-The appliance according to Claim 2, wherein a hub integral with the flange and projecting internally from the flange is arranged with an inner bore allowing axial guidance of the pusher member and receives rotatably, on its periphery, the pinions (P1-P2)first pinion and the second pinion secured to one another, and the pusher member is profiled at its front end with a conical profile capable of cooperating with the operating lever and at an other end with a conical profile extended by an appendage so as to be accommodated in an orifice formed on a guide cap integral with the first pinion (P4+).
- 4. (Currently Amended) Selector-device The appliance according to Claim 2, wherein the first pinion (P1) is arranged so as to receive a guide cap allowing axial displacement of the pusher member and radial displacement of two profiled cams in a inner volume of the cap, forming a guide track, this taking place counter to an elastic retaining and return means, and the first pinion (P1) is arranged with an oblique window allowing passage and, in some situations;

projection of an end of one of the cams so as to come into contact with and push on the <u>third</u> pinion-(P3) for the purpose of retracting the third pinion-(P3).

- (Currently Amended) Selector device-The appliance according to Claim 4, wherein the cams are arranged on either side of the other end of the pusher member and have an oblique profile for cooperating with the said other end.
- 6. (Currently Amended) Selector device-The appliance according to Claim 2, wherein the flange has on the outside a projecting shape with three zones defining internally cavities for receiving components of the device and drum and pressing roller parts, a first zone of said zones receiving the hub and pusher member and having in its lower part a window-forming cutout for receiving an elastically retractable flap carrying a supporting shaft of the third pinion (P33).
- 7. (Currently Amended) Selector device The appliance according to Claim 4, wherein the third pinion (P3) is arranged on its inside with a projecting stop cooperating with an end of a first cam of said two profiled cams when the said first cam is stressed in terms of radial displacement under action of the pusher member stressed by the operating lever.
- 8. (Currently Amended) Selector-device-The appliance according to Claim 6, wherein the flange has a second cylindrical zone of said projecting shape having a central orifice allowing a shaft of the pressing roller to be received, a depth of a cavity of this second zone being such that the <u>fifth pinion (P5)</u>-positioned on the pressing roller is capable of meshing with the first pinion (P1).
- 9. (Currently Amended) Selector-device-The appliance according to Claim 6, wherein the flange has a third cylindrical zone of said projecting shape with an axis X corresponding to an axis of the drum receiving the cutting device, a depth of a cavity of the third zone being such that a seventh pinion (P7) arranged on the drum and comprising a toothed quadrant with four teeth is capable of meshing with the third pinion (P3).
- (Currently Amended) Selector-device-The appliance according to Claim 9, wherein the drum has, on a supporting shaft of the seventh pinion-(P7), [[a]]an eighth pinion (P8)

cooperating with a pinion mounted at an end of the cutting-blade support in order to ensure the emergence of the blade.

11. (Currently Amended) Selector-device-The appliance according to Claim 9, wherein the drum has a sixth pinion (P6)-capable of meshing with a fourth pinion (P4) set up on the pressing roller.
